

## HLD Quora

- 1) Define MVP → Minimum Viable Product
  - 2) Estimation of Scale → storage, Read/Write, QPS  
(Queries per sec)
  - 3) Design Goals → latency, Availability/consistency
  - 4) API & Design Challenges
- 

### 1) Define MVP

- a) Post Questions
  - b) Answer Questions
  - c) Upvote/Downvote
  - d) User Profile → login/logout
  - e) News feed ✓
  - f) Searching ← (not in MVP)
  - g) Topics for a question (user can follow topics)
  - h) Ranking Answers.
- 

### 2) Estimation of Scale

≈ 300 M MAU (Monthly Active Users)  
= 50 M DAU (Daily Active Users)  
= 10K questions per day  
= 5 Answers per question

### a) Data to Store →

5 years

Questions  $\rightarrow$  10K que/day

0.5 KB

$$10^4 * 365 * 5 \rightarrow \underline{18.25 M} \quad (1M \rightarrow 10^6)$$

Answers  $\rightarrow$  5 per question

2 KB

$$18.25 * 5 \rightarrow \underline{91.25 M}$$

O/A  $\rightarrow$  text  $\rightarrow$  string  $\rightarrow$  set of characters  $\rightarrow$  1B

Question  $\rightarrow$  0.5 KB (500 characters)

Answer  $\rightarrow$  2 KB (2000 characters)

$$\begin{aligned} \text{Data to store} &\rightarrow (18.25 * 0.5 \text{ B} + 91.25 * 2 \text{ B}) * 10^6 * 10^3 \\ &= 190 * 10^9 \rightarrow \underline{190 \text{ GB}} \end{aligned}$$

200 GB  $\rightarrow$  store in one machine

Replication  $\rightarrow$  store same data in multiple machines.

Read / Write Heavy

50M DAU

Read Heavy System

10K questions per day

5 Answers per question

QPS  $\rightarrow$  Queries Per Second

---

Design Goals    1) latency → important but not critical.

2) Consistency vs Availability (CAP)

↓ X  
same data at  
all times.

---

Storage → 200GB (1 machine)

MySQL

Questions → id, userId, text, t.s, upvotes, downvotes)

Answers → id, userId, text, t.s, qId, upvotes, downvotes)

Topics → id, text, t.s

User Data → id, name, email, . . . .

Question-Topic → qId, tId

User-Topic → uId, tId

---

API → 1) add Questions (userId, text, topics, queId, ts)  
just one entry in question table.

2) add Answer (userId, text, queId, ansId, ts)  
just one entry in answer table.

3)  $\text{upvoteQuestion}(\text{userId}, \text{questionId})$  } same for or server  
 4)  $\text{downvoteQuestion}(\text{userId}, \text{questionId})$  }

5)  $\text{getNewsFeed}(\text{userId}, \text{number of Results}, \text{offset})$   
 (homepage)  $\checkmark 5/10/20$   $1/6/11$

a) User without log-in

✓ popular questions  $\rightarrow$  asked recently  
 most upvote questions ✓

Question  $\rightarrow$  100 votes ✓ (today)

Question  $\rightarrow$  1000 votes ✓ (last week)

Time Decay  $\rightarrow$  1.1 per day (subjective)

$\textcircled{110}$   $\rightarrow$   $110/1.1 = \boxed{100}$   $\rightarrow$   $100/1.1 = \textcircled{91} \dots$   
 today day 2 day 3

Question 1  $\rightarrow$  60 upvotes today + 50 upvotes yesterday + 100 upvotes day before yesterday  
 $\frac{50}{1.1} = 45$   $\frac{100}{(1.1)^2} = 82$   
 $60 + 45 + 82 = \underline{187}$  ✓

Question 2  $\rightarrow$  100 upvotes today ✓

Decay

$\textcircled{1.2}$  per day  $\frac{100}{1.2}$  today  $\frac{120}{1.2}$  yesterday  $\frac{150}{(1.2)^2}$  day before  
 $\frac{120}{1.2} = 100$   $\frac{150}{(1.2)^2} = \underline{104}$  ✓

log-in user

user → topics → question wrt topics  
limited

cache (store) ✓

topic → top 20 questions (recency + upvotes)

→ update after a certain time (after every 4 hours ← eg) ✓

→ when for a question the count of upvotes reach  
multiple of 50 or 100. ✓

H.W → Rank answers for a question. ✓
